

## Patch Management Got You Down?

With everyone working from home patch management procedures have been either been thrown out the window or are seriously lacking.

### FIX THE FILE NOT THE APPLICATION!

At Glasswall we are going to take all files intended for your users endpoint and put them to a known good standard using our patented d-FIRST™ Methodology ensuring that malware cannot exploit any of the vulnerabilities that are on your systems due to not being able to patch.

Let Glasswall be your patch management before you patch.

The combination of FileTrust for Email and FileTrust Share Safe will ensure that malware doesn't enter your enterprise from either email or your popular share applications.

Security and IT professionals across the country are crossing their fingers that their colleagues don't receive a malicious attachment that could compromise others or even take them down the entire organization.

Glasswall neutralizes malicious attachments at the email gateway and while being shared, killing threats before they reach unreliable and inconsistent home computer security software and unpatched applications.

At \$5.25 per user per month, FileTrust for Email and FileTrust Share Safe deliver outstanding protection at a low cost. Delivered as a cloud-hosted service, it's also quick and easy to deploy.
